# Chapter 1

## Unit collects

### 1.1 Description

Collection units

This routine contains collection objects, being quite similar to those included in the objects unit. The only difference being that they compile on all compiler targets.

### 1.2 Overview

### 1.3 Classes, Interfaces and Objects

**TStack Object** \_\_\_\_\_

**Hierarchy**

TStack > TObject

**TExtendedCollection Object** \_\_\_\_\_

**Hierarchy**

TExtendedCollection > TObject

**TExtendedSortedCollection Object** \_\_\_\_\_

**Hierarchy**

TExtendedSortedCollection > TExtendedCollection(1.3) > TObject

### 1.4 Author

Carl Eric Codere

# Chapter 2

## Unit crc

### 2.1 Description

CRC generation unit

CRC generation routines, compatible with ISO 3309 and ITU-T-V42.

### 2.2 Overview

UpdateCrc32

### 2.3 Functions and Procedures

#### UpdateCrc32 function

---

**Declaration** `function UpdateCrc32(InitCrc:longword; b: byte):longword;`

**Description** Routine to get the CRC-32 value.

Normally to be compatible with the ISO 3309 standard, the first call to this routine should set `InitCRC` to `$FFFFFFFF`, and the final result of the CRC-32 should be XOR'ed with `$FFFFFFFF`.

**Parameters** `InitCRC` The value of the previous CRC

`b` The data byte to get the CRC-32 of

**Returns** The updated CRC-32 value

### 2.4 Author

Carl Eric Codere

## Chapter 3

# Unit dpautils

### 3.1 Description

Delphi/Kylix compatibility unit

This unit includes common definitions so that common code can be compiled under the Delphicompilers. It supports Delphi 6 and higher that are targeted for Win32 as well as WDOSX/DOS.

### 3.2 Author

Carl Eric Codere

## Chapter 4

# Unit fpautils

### 4.1 Description

Free Pascal compatibility unit

This unit includes common definitions so that common code can be compiled under the Free pascal compilers. It supports Freepascal 1.0.6 and higher (all targets).

### 4.2 Author

Carl Eric Codere

# Chapter 5

## Unit ietf

### 5.1 Description

ietf/web related support unit

This unit contains routines to validate strings, and characters according to different IETF standards (such as URL's, URI's and MIME types).

### 5.2 Overview

`urn_isvalid` Verifies the validity of a complete URN string

`urn_isvalidnid`

`urn_split` Splits an URN string in its separate components

### 5.3 Functions and Procedures

`urn_isvalid` function

---

**Declaration** `function urn_isvalid(s: shortstring): boolean;`

**Description** Verifies the validity of a complete URN string

This checks the conformance of the URN address. It is based on IETF RFC 2141.

**Returns** TRUE if this is a valid URN string

`urn_isvalidnid` function

---

**Declaration** `function urn_isvalidnid(nid: string): boolean;`

**Description** This routine checks that the specified NID (namespace) is either registered to IANA, or that it is an experimental NID, as described in IETF RFC 2611. More assignment information can be obtained from: <http://www.iana.org/assignments/urn-namespaces>

**Returns** TRUE if this is a registered or experimental NID string

## urn\_split function

---

**Declaration** `function urn_split(urn:string; var urnidstr,nidstr,nssstr: string): boolean;`

**Description** Splits an URN string in its separate components

It is based on IETF RFC 2141.

nidstr Namespace identifier NID

**Parameters** **urn** Complete URN string to separate

**urnidstr** Signature URN:

**nssstr** Namespace specific string NSS

**Returns** TRUE if the operation was successfull, or FALSE if the URN is malformed

## 5.4 Author

Carl Eric Codere

# Chapter 6

## Unit iso3166

### 6.1 Description

Country code unit

This unit is used to check the country codes as well as return information on the country, according to ISO 3166.

The lists were converted from the semicolon delimited version available here: <http://www.iso.org/iso/en/prods-services/iso3166ma/>

### 6.2 Overview

`isvalidcountrycode` Verifies if the 2 letter country code is valid

### 6.3 Functions and Procedures

#### `isvalidcountrycode` function

---

**Declaration** `function isvalidcountrycode(s: shortstring): boolean;`

**Description** Verifies if the 2 letter country code is valid

This routine checks if the two letter country code is valid (as defined in ISO3166-1). The country code is not case sensitive.

**Parameters** `s` The three digit country code

**Returns** TRUE if the country code is valid, otherwise returns FALSE

### 6.4 Author

Carl Eric Codere

# Chapter 7

## Unit iso639

### 7.1 Description

Language code unit

This unit is used to check the language codes as well as return information on the country, according to ISO 639-1 and ISO 639-2.

The database was taken from the following site: [http://www.loc.gov/standards/iso639-2/ISO-639-2\\_values\\_8bits.txt](http://www.loc.gov/standards/iso639-2/ISO-639-2_values_8bits.txt)

### 7.2 Overview

`isvalidlangcode` Verifies if the 2 or 3 letter language code is valid

### 7.3 Functions and Procedures

#### `isvalidlangcode` function

---

**Declaration** `function isvalidlangcode(s: shortstring): boolean;`

**Description** Verifies if the 2 or 3 letter language code is valid

This routine checks if the two or three letter language code is valid (as defined in ISO 639, part 1 and part 2 respectively). The language code IS case sensitive and should be in lower case.

**Parameters** `s` The two or three digit language code

**Returns** TRUE if the language code is valid, otherwise returns FALSE

### 7.4 Author

Carl Eric Codere

# Chapter 8

## Unit locale

### 8.1 Description

Localisation unit

This unit is used to convert different locale information. ISO Standards are used where appropriate.

Credits where credits are due, information on the ISO and date formats where taken from <http://www.cl.cam.ac.uk/mgk25/iso-time.html>

### 8.2 Overview

`GetCharEncoding`

`GetISODateString`

`GetISOTimeString`

`IsValidISODateString` Verifies if the date is in a valid ISO 8601 format

`IsValidISODateTimeString` Verifies if the date and time is in a valid ISO 8601 format

`IsValidISOTimeString` Verifies if the time is in a valid ISO 8601 format

`UNIXToDateTime`

### 8.3 Functions and Procedures

#### `GetCharEncoding` function

---

**Declaration** `function GetCharEncoding(alias: string; var _name: string): integer;`

**Description** Using a registered ALIAS name for a specific character encoding, return the common or MIME name associated with this character set, and indicate the type of stream format used. The type of stream format used can be one of the `CHAR_ENCODING_XXXX` constants.

## GetISODateString function

---

**Declaration** `function GetISODateString(Year, Month, Day: Word): shortstring;`

**Description** Returns the preferred date string as recommended by ISO 8601 (Gregorian Calendar).  
Returns an empty string if there is an error.

**Parameters** **year** Year of the date - valid values are from 0000 to 9999  
**month** Month of the date - valid values are from 0 to 12  
**day** Day of the month - valid values are from 1 to 31

## GetISOTimeString function

---

**Declaration** `function GetISOTimeString(Hour, Minute, Second: Word; UTC: Boolean): shortstring;`

**Description** Returns the preferred time string as recommended by ISO 8601 (Gregorian Calendar).

**Returns** Empty string if there is an error

## IsValidISODateString function

---

**Declaration** `function IsValidISODateString(datestr: shortstring): boolean;`

**Description** Verifies if the date is in a valid ISO 8601 format

**Parameters** **datestr** Date string in valid ISO 8601 format

**Returns** TRUE if the date string is valid otherwise false

## IsValidISODateTimeString function

---

**Declaration** `function IsValidISODateTimeString(str: shortstring): boolean;`

**Description** Verifies if the date and time is in a valid ISO 8601 format

Currently does not support the fractional second parameters, and only the format recommended by W3C when used with the time zone designator.

**Parameters** **str** Date-Time string in valid ISO 8601 format

**Returns** TRUE if the date-time string is valid otherwise false

### IsValidISOTimeString function

---

**Declaration** `function IsValidISOTimeString(timestr: shortstring): boolean;`

**Description** Verifies if the time is in a valid ISO 8601 format

Currently does not support the fractional second parameters, and only the format recommended by W3C when used with the time zone designator.

**Parameters** `timestr` Time string in valid ISO 8601 format

**Returns** TRUE if the time string is valid otherwise false

### UNIXToDateTime procedure

---

**Declaration** `procedure UNIXToDateTime(epoch: longword; var year, month, day, hour, minute, second: Word);`

**Description** Converts a UNIX styled time (the number of seconds since 1970) to a standard date and time representation.

## 8.4 Constants

### CHAR\_ENCODING\_UTF8

---

**Declaration** `CHAR_ENCODING_UTF8 = 0;`

**Description** Character encoding value: UTF-8 storage format

### CHAR\_ENCODING\_UNKNOWN

---

**Declaration** `CHAR_ENCODING_UNKNOWN = -1;`

**Description** Character encoding value: unknown format

### CHAR\_ENCODING\_UTF32BE

---

**Declaration** `CHAR_ENCODING_UTF32BE = 1;`

**Description** Character encoding value: UTF-32 Big endian

### CHAR\_ENCODING\_UTF32LE

---

**Declaration** `CHAR_ENCODING_UTF32LE = 2;`

**Description** Character encoding value: UTF-32 Little endian

### CHAR\_ENCODING\_UTF16LE

---

**Declaration** `CHAR_ENCODING_UTF16LE = 3;`

**Description** Character encoding value: UTF-16 Little endian

## **CHAR\_ENCODING\_UTF16BE**

---

**Declaration** CHAR\_ENCODING\_UTF16BE = 4;

**Description** Character encoding value: UTF-16 Big endian

## **CHAR\_ENCODING\_BYTE**

---

**Declaration** CHAR\_ENCODING\_BYTE = 5;

**Description** Character encoding value: One byte per character storage format

## **CHAR\_ENCODING\_UTF16**

---

**Declaration** CHAR\_ENCODING\_UTF16 = 6;

**Description** Character encoding value: UTF-16 unknown endian (determined by BOM)

## **CHAR\_ENCODING\_UTF32**

---

**Declaration** CHAR\_ENCODING\_UTF32 = 7;

**Description** Character encoding value: UTF-32 unknown endian (determined by BOM)

## **8.5 Author**

Carl Eric Codere

## Chapter 9

# Unit `tputils`

### 9.1 Description

Turbo Pascal 7 Compatibility unit

This unit includes common definitions so that common code can be compiled under the Turbo/Borland pascal compilers. It supports both Turbo Pascal 7.0 and Borland Pascal 7.0 and higher.

### 9.2 Author

Carl Eric Codere

# Chapter 10

## Unit unicode

### 10.1 Description

unicode support unit

This unit contains routines to convert between the different unicode encoding schemes.

All UNICODE/ISO 10646 pascal styled strings are limited to 255 characters. Null terminated unicode strings are limited by the compiler and integer type size.

Since all these encoding are variable length, except the UCS-4 (which is equivalent to UTF-32 according to ISO 10646:2003) and UCS-2 encoding, to parse through characters, every string should be converted to UCS-4 or UCS-2 before being used.

The principal encoding scheme for this unit is UCS-4.

### 10.2 Overview

`ConvertFromUCS4` Convert an UCS-4 string to a single byte encoded string

`ConvertToUCS4` Convert a byte encoded string to an UCS-4 string

`ConvertUCS2ToUCS4` Convert an UCS-2 string to an UCS-4 string

`ConvertUCS4ToUCS2` Convert an UCS-4 string to an UCS-2 string

`ConvertUCS4toUTF16` Convert an UCS-4 string to an UTF-16 string

`convertUCS4toUTF8` Convert an UCS-4 string to an UTF-8 string

`ConvertUTF16ToUCS4` Convert an UTF-16 string to an UCS-4 string

`ConvertUTF8ToUCS4` Convert an UTF-8 string to an UCS-4 string

`lengthUTF16` Returns the current length of an UTF-16 string

`lengthutf8` Returns the current length of an UTF-8 string

`setlengthUTF16` Set the length of an UTF-16 string

`setlengthUTF8` Set the length of an UTF-8 string

`ucs2strdispose` Disposes of an UCS-2 null terminated string on the heap

`ucs2strlcopyucs4` Convert an UCS-2 null terminated string to an UCS-4 null terminated string

`ucs2strlen` Returns the number of characters in the null terminated UCS-2 string

`ucs2strnew` Converts an UCS-4 null terminated string to an UCS-2 null terminated string

`ucs2_isvalid` Checks if the UCS-2 character is valid

`ucs2.length` Returns the current length of an UCS-2 string

`ucs2.setlength` Set the new dynamic length of an ucs-2 string

`ucs4strdispose` Disposes of an UCS-4 null terminated string on the heap

`ucs4strlen` Returns the number of characters in the null terminated UCS-4 string

`ucs4strnew` Converts a null terminated string to an UCS-4 null terminated string

`ucs4strnewstr` Converts a pascal string to an UCS-4 null terminated string

`ucs4strpas` Converts a null-terminated UCS-4 string to a Pascal-style UCS-4 string.

`ucs4strpastoASCII` Converts a null-terminated UCS-4 string to a Pascal-style ASCII encoded string.

`ucs4strpastoISO8859_1` Converts a null-terminated UCS-4 string to a Pascal-style ISO 8859-1 encoded string.

`ucs4strpcopy` Copies a Pascal-style UCS-4 string to a null-terminated UCS-4 string.

`ucs4.concat` Concatenates two UCS-4 strings, and gives a resulting UCS-4 string

`ucs4.concatascii` Concatenates an UCS-4 string with an ASCII string, and gives a resulting UCS-4 string

`ucs4.copy` Returns an UCS-4 substring of an UCS-4 string

`ucs4.delete` Deletes a substring from a string

`ucs4.equal` Checks if both UCS-4 strings are equal

`ucs4.equalascii` Checks if an ASCII string is equal to an UCS-4 string

`ucs4.issupported` Checks if conversion from/to this character set format to/from UCS-4 is supported

`ucs4_isvalid` Checks if the UCS-4 character is valid

`ucs4.iswhitespace` Determines if the specified character is a whitespace character

`ucs4.length` Returns the current length of an UCS-4 string

`ucs4_lowercase` Converts a character to a lowercase character

`ucs4_pos` Searches for an UCS-4 substring in an UCS-4 string

`ucs4_posascii` Searches for an ASCII substring in an UCS-4 string

`ucs4_setlength` Set the new dynamic length of an UCS-4 string

`ucs4_trimleft` Trims leading spaces and control characters from an UCS-4 string.

`ucs4_trimright` Trims trailing spaces and control characters from an UCS-4 string.

`ucs4_upcase` Converts a character to an uppercase character

`utf16_sizeencoding` Returns the number of characters that are used to encode this character

`utf8strdispose` Disposes of an UTF-8 null terminated string on the heap

`utf8strlcopyucs4` Convert an UTF-8 null terminated string to an UCS-4 null terminated string

`utf8strnew` Converts an UCS-4 null terminated string to an UTF-8 null terminated string

`utf8strnewutf8` Allocates and copies an UTF-8 null terminated string

`utf8strpastoASCII` Converts a null-terminated UTF-8 string to a Pascal-style ASCII encoded string.

`utf8strpastoISO8859_1` Converts a null-terminated UTF-8 string to a Pascal-style ISO 8859-1 encoded string.

`utf8_sizeencoding` Returns the number of characters that are used to encode this character

## 10.3 Functions and Procedures

### ConvertFromUCS4 function

---

**Declaration** `function ConvertFromUCS4(source: ucs4string; var dest: string; desttype: string): integer;`

**Description** Convert an UCS-4 string to a single byte encoded string

This routine converts an UCS-4 string stored in native byte order (native endian) to a single-byte encoded string.

The string is limited to 255 characters, and if the conversion cannot be successfully be completed, it gives out an error. The following **desttype** can be specified: ISO-8859-1, windows-1252, ISO-8859-2, ISO-8859-5, ISO-8859-16, macintosh, atari, cp437, cp850, ASCII.

**Parameters** **desttype** Indicates the single byte encoding scheme

**Returns** `UNICODE_ERR_OK(10.5)` if there was no error in the conversion

## ConvertToUCS4 function

---

**Declaration** `function ConvertToUCS4(source: string; var dest: ucs4string; srctype: string): integer;`

**Description** Convert a byte encoded string to an UCS-4 string

This routine converts a single byte encoded string to an UCS-4 string stored in native byte order

Characters that cannot be converted are converted to escape sequences of the form : \uxxxxxxxx where xxxxxxxx is the hex representation of the character, an error code will also be returned by the function

The string is limited to 255 characters, and if the conversion cannot be successfully be completed, it gives out an error. The following **srctype** can be specified: ISO-8859-1, windows-1252, ISO-8859-2, ISO-8859-5, ISO-8859-16, macintosh, atari, cp437, cp850, ASCII.

**Parameters** **srctype** Indicates the single byte encoding scheme

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

## ConvertUCS2ToUCS4 function

---

**Declaration** `function ConvertUCS2ToUCS4(src: array of ucs2char; var dst: ucs4string): integer;`

**Description** Convert an UCS-2 string to an UCS-4 string

This routine converts an UCS-2 string to an UCS-4 string that is stored in native byte order (big-endian). If some characters could not be converted an error will be reported.

**Parameters** **src** Either a single ucs-2 character or a complete ucs-2 string  
**dest** Resulting UCS-4 coded string

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

## ConvertUCS4ToUCS2 function

---

**Declaration** `function ConvertUCS4ToUCS2(src: array of ucs4char; var dst: ucs2string): integer;`

**Description** Convert an UCS-4 string to an UCS-2 string

This routine converts an UCS-4 string to an UCS-2 string that is stored in native byte order. If some characters could not be converted an error will be reported.

**Parameters** **src** Either a single UCS-4 character or a complete UCS-4 string  
**dest** Resulting UCS-2 coded string

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

## ConvertUCS4toUTF16 function

---

**Declaration** `function ConvertUCS4toUTF16(src: array of ucs4char; var dest: utf16string): integer;`

**Description** Convert an UCS-4 string to an UTF-16 string

This routine converts an UCS-4 string to an UTF-16 string. Both strings must be stored in native byte order (native endian).

**Parameters** **src** Either a single UCS-4 character or a complete UCS-4 string  
**dest** Resulting UTF-16 coded string

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

## convertUCS4toUTF8 function

---

**Declaration** `function convertUCS4toUTF8(s: array of ucs4char; var outstr: utf8string): integer;`

**Description** Convert an UCS-4 string to an UTF-8 string

Converts an UCS-4 string or character in native endian to an UTF-8 string.

**Parameters** **s** Either a single UCS-4 character or a complete UCS-4 string  
**outstr** Resulting UTF-8 coded string

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

## ConvertUTF16ToUCS4 function

---

**Declaration** `function ConvertUTF16ToUCS4(src: utf16string; var dst: ucs4string): integer;`

**Description** Convert an UTF-16 string to an UCS-4 string

This routine converts an UTF-16 string to an UCS-4 string. Both strings must be stored in native byte order (native endian).

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

## ConvertUTF8ToUCS4 function

---

**Declaration** `function ConvertUTF8ToUCS4(src: utf8string; var dst: ucs4string): integer;`

**Description** Convert an UTF-8 string to an UCS-4 string

This routine converts an UTF-8 string to an UCS-4 string that is stored in native byte order.

**Returns** UNICODE\_ERR\_OK(10.5) if there was no error in the conversion

### lengthUTF16 function

---

**Declaration** `function lengthUTF16(s: array of utf16char): integer;`

**Description** Returns the current length of an UTF-16 string

### lengthutf8 function

---

**Declaration** `function lengthutf8(s: array of utf8char): integer;`

**Description** Returns the current length of an UTF-8 string

### setlengthUTF16 procedure

---

**Declaration** `procedure setlengthUTF16(var s: array of utf16char; l: integer);`

**Description** Set the length of an UTF-16 string

### setlengthUTF8 procedure

---

**Declaration** `procedure setlengthUTF8(var s: array of utf8char; l: integer);`

**Description** Set the length of an UTF-8 string

### ucs2strdispose function

---

**Declaration** `function ucs2strdispose(str: pucs2char): pucs2char;`

**Description** Disposes of an UCS-2 null terminated string on the heap

Disposes of a string that was previously allocated with `ucs2strnew`, and sets the pointer to `nil`.

### ucs2strlcopyucs4 function

---

**Declaration** `function ucs2strlcopyucs4(src: pucs2char; dst: pucs4char; maxlen: integer): pucs4char;`

**Description** Convert an UCS-2 null terminated string to an UCS-4 null terminated string

This routine converts an UCS-2 encoded null terminated string to an UCS-4 null terminated string that is stored in native byte order, up to length conversion.

**Returns** `nil` if there was no error in the conversion

### ucs2strlen function

---

**Declaration** `function ucs2strlen(str: pucs2char): integer;`

**Description** Returns the number of characters in the null terminated UCS-2 string

**Parameters** `str` The UCS-2 null terminated string to check

**Returns** The number of characters in `str`, not counting the null character

## ucs2strnew function

---

**Declaration** `function ucs2strnew(src: pucs4char): pucs2char;`

**Description** Converts an UCS-4 null terminated string to an UCS-2 null terminated string

The memory for the buffer is allocated. Use `ucs2strdispose(10.3)` to dispose of the allocated string. The string is null terminated.

**Returns** nil if the conversion cannot be represented in UCS-2 encoding, or nil if there was an error

## ucs2\_isvalid function

---

**Declaration** `function ucs2_isvalid(ch: ucs2char): boolean;`

**Description** Checks if the UCS-2 character is valid

This routine verifies if the UCS-2 character is within the valid ranges of UCS-2 characters, as specified in the Unicode standard 4.0. BOM characters are NOT valid with this routine.

## ucs2\_length function

---

**Declaration** `function ucs2_length(s: array of ucs2char): integer;`

**Description** Returns the current length of an UCS-2 string

## ucs2\_setlength procedure

---

**Declaration** `procedure ucs2_setlength(var s: array of ucs2char; l: integer);`

**Description** Set the new dynamic length of an ucs-2 string

## ucs4strdispose function

---

**Declaration** `function ucs4strdispose(str: pucs4char): pucs4char;`

**Description** Disposes of an UCS-4 null terminated string on the heap

Disposes of a string that was previously allocated with `ucs4strnew`, and sets the pointer to nil.

## ucs4strlen function

---

**Declaration** `function ucs4strlen(str: pucs4char): integer;`

**Description** Returns the number of characters in the null terminated UCS-4 string

**Parameters** `str` The UCS-4 null terminated string to check

**Returns** The number of characters in `str`, not counting the null character

## ucs4strnew function

---

**Declaration** `function ucs4strnew(str: pchar; srctype: string): pucs4char;`

**Description** Converts a null terminated string to an UCS-4 null terminated string

The memory for the buffer is allocated. Use `ucs4strdispose(10.3)` to dispose of the allocated string. The string is null terminated.

**Parameters** `str` The string to convert, single character coded, or UTF-8 coded  
`srctype` The encoding of the string, UTF-8 is also valid

## ucs4strnewstr function

---

**Declaration** `function ucs4strnewstr(str: string; srctype: string): pucs4char;`

**Description** Converts a pascal string to an UCS-4 null terminated string

The memory for the buffer is allocated. Use `ucs4strdispose(10.3)` to dispose of the allocated string. The string is null terminated. If the original string contains some null characters, those nulls are removed from the resulting string.

**Parameters** `str` The string to convert, single character coded  
`srctype` The encoding of the string, UTF-8 is also valid

## ucs4strpas procedure

---

**Declaration** `procedure ucs4strpas(str: pucs4char; var res:ucs4string);`

**Description** Converts a null-terminated UCS-4 string to a Pascal-style UCS-4 string.

## ucs4strpastoASCII function

---

**Declaration** `function ucs4strpastoASCII(str: pucs4char): string;`

**Description** Converts a null-terminated UCS-4 string to a Pascal-style ASCII encoded string.

Characters that cannot be converted are converted to escape sequences of the form : `\uxxxxxxxx` where xxxxxxxx is the hex representation of the character.

## ucs4strpastoISO8859\_1 function

---

**Declaration** `function ucs4strpastoISO8859_1(str: pucs4char): string;`

**Description** Converts a null-terminated UCS-4 string to a Pascal-style ISO 8859-1 encoded string.

Characters that cannot be converted are converted to escape sequences of the form : `\uxxxxxxxx` where xxxxxxxx is the hex representation of the character.

### ucs4strcpy function

---

**Declaration** `function ucs4strcpy(dest: pucs4char; source: ucs4string):pucs4char;`

**Description** Copies a Pascal-style UCS-4 string to a null-terminated UCS-4 string.

This routine does not perform any length checking. If the source string contains some null characters, those nulls are removed from the resulting string.

The destination buffer must have room for at least `Length(Source)+1` characters.

### ucs4\_concat procedure

---

**Declaration** `procedure ucs4_concat(var resultstr: ucs4string; s1: ucs4string; s2: array of ucs4char);`

**Description** Concatenates two UCS-4 strings, and gives a resulting UCS-4 string

### ucs4\_concatascii procedure

---

**Declaration** `procedure ucs4_concatascii(var resultstr: ucs4string; s1: ucs4string; s2: string);`

**Description** Concatenates an UCS-4 string with an ASCII string, and gives a resulting UCS-4 string

### ucs4\_copy procedure

---

**Declaration** `procedure ucs4_copy(var resultstr: ucs4string; s: array of ucs4char; index: integer; count: integer);`

**Description** Returns an UCS-4 substring of an UCS-4 string

### ucs4\_delete procedure

---

**Declaration** `procedure ucs4_delete(var s: ucs4string; index: integer; count: integer);`

**Description** Deletes a substring from a string

### ucs4\_equal function

---

**Declaration** `function ucs4_equal(const s1,s2: ucs4string): boolean;`

**Description** Checks if both UCS-4 strings are equal

### ucs4\_equalascii function

---

**Declaration** `function ucs4_equalascii(s1 : array of ucs4char; s2: string): boolean;`

**Description** Checks if an ASCII string is equal to an UCS-4 string

### ucs4\_issupported function

---

**Declaration** `function ucs4_issupported(s: string): boolean;`

**Description** Checks if conversion from/to this character set format to/from UCS-4 is supported

**Parameters** `s` This is an alias for a character set, as defined by IANA

**Returns** true if conversion to/from UCS-4 is supported with this character set, otherwise FALSE

### ucs4\_isvalid function

---

**Declaration** `function ucs4_isvalid(c: ucs4char): boolean;`

**Description** Checks if the UCS-4 character is valid

This routine verifies if the UCS-4 character is within the valid ranges of UCS-4 characters, as specified in the Unicode standard 4.0. BOM characters are NOT valid with this routine.

### ucs4\_iswhitespace function

---

**Declaration** `function ucs4_iswhitespace(c: ucs4char): boolean;`

**Description** Determines if the specified character is a whitespace character

### ucs4\_length function

---

**Declaration** `function ucs4_length(s: array of ucs4char): integer;`

**Description** Returns the current length of an UCS-4 string

### ucs4\_lowercase function

---

**Declaration** `function ucs4_lowercase(c: ucs4char): ucs4char;`

**Description** Converts a character to a lowercase character

This routine only supports the simple form case folding algorithm (e.g full form is not supported).

### ucs4\_pos function

---

**Declaration** `function ucs4_pos(substr: ucs4string; s: ucs4string): integer;`

**Description** Searches for an UCS-4 substring in an UCS-4 string

### ucs4\_posascii function

---

**Declaration** `function ucs4_posascii(substr: string; s: ucs4string): integer;`

**Description** Searches for an ASCII substring in an UCS-4 string

### **ucs4\_setlength procedure**

---

**Declaration** `procedure ucs4_setlength(var s: array of ucs4char; l: integer);`

**Description** Set the new dynamic length of an UCS-4 string

### **ucs4\_trimleft procedure**

---

**Declaration** `procedure ucs4_trimleft(var s: ucs4string);`

**Description** Trims leading spaces and control characters from an UCS-4 string.

### **ucs4\_trimright procedure**

---

**Declaration** `procedure ucs4_trimright(var s: ucs4string);`

**Description** Trims trailing spaces and control characters from an UCS-4 string.

### **ucs4\_upcase function**

---

**Declaration** `function ucs4_upcase(c: ucs4char): ucs4char;`

**Description** Converts a character to an uppercase character

This routine only supports the simple form case folding algorithm (e.g full form is not supported).

### **utf16\_sizeencoding function**

---

**Declaration** `function utf16_sizeencoding(c: utf16char): integer;`

**Description** Returns the number of characters that are used to encode this character

.  
Actually checks if this is a high-surrogate value, if not returns 1, indicating that the character is encoded a single `utf16` character, otherwise returns 2, indicating that 1 one other `utf16` character is required to encode this data.

### **utf8strdispose function**

---

**Declaration** `function utf8strdispose(str: pchar): pchar;`

**Description** Disposes of an UTF-8 null terminated string on the heap

Disposes of a string that was previously allocated with `utf8strnew`, and sets the pointer to `nil`.

### utf8strncpyucs4 function

---

**Declaration** `function utf8strncpyucs4(src: pchar; dst: pucs4char; maxlen: integer): pucs4char;`

**Description** Convert an UTF-8 null terminated string to an UCS-4 null terminated string

This routine converts an UTF-8 null terminated string to an UCS-4 null terminated string that is stored in native byte order, up to length conversion.

**Returns** nil if there was no error in the conversion

### utf8strnew function

---

**Declaration** `function utf8strnew(src: pucs4char): pchar;`

**Description** Converts an UCS-4 null terminated string to an UTF-8 null terminated string

The memory for the buffer is allocated. Use `utf8strdispose(10.3)` to dispose of the allocated string. The string is null terminated.

### utf8strnewutf8 function

---

**Declaration** `function utf8strnewutf8(src: pchar): pchar;`

**Description** Allocates and copies an UTF-8 null terminated string

The memory for the buffer is allocated. Use `utf8strdispose(10.3)` to dispose of the allocated string. The string is copied from src and is null terminated.

### utf8strpastoASCII function

---

**Declaration** `function utf8strpastoASCII(src: pchar): string;`

**Description** Converts a null-terminated UTF-8 string to a Pascal-style ASCII encoded string.

Characters that cannot be converted are converted to escape sequences of the form : `\uxxxxxxxx` where xxxxxxxx is the hex representation of the character.

### utf8strpastoISO8859\_1 function

---

**Declaration** `function utf8strpastoISO8859_1(src: pchar): string;`

**Description** Converts a null-terminated UTF-8 string to a Pascal-style ISO 8859-1 encoded string.

Characters that cannot be converted are converted to escape sequences of the form : `\uxxxxxxxx` where xxxxxxxx is the hex representation of the character.

### utf8\_sizeencoding function

---

**Declaration** `function utf8_sizeencoding(c: utf8char): integer;`

**Description** Returns the number of characters that are used to encode this character

## 10.4 Types

### utf8char

---

**Declaration** `utf8char = char;`

**Description** UTF-8 base data type

### utf16char

---

**Declaration** `utf16char = word;`

**Description** UTF-16 base data type

### ucs4char

---

**Declaration** `ucs4char = longword;`

**Description** UCS-4 base data type

### pucs4char

---

**Declaration** `pucs4char = ^ucs4char;`

**Description** UCS-4 null terminated string

### ucs2char

---

**Declaration** `ucs2char = word;`

**Description** UCS-2 base data type

### ucs2string

---

**Declaration** `ucs2string = array[0..255] of ucs2char;`

**Description** UCS-2 string declaration. Index 0 contains the active length of the string in characters.

### ucs4string

---

**Declaration** `ucs4string = array[0..255] of ucs4char;`

**Description** UCS-4 string declaration. Index 0 contains the active length of the string in characters.

## **utf8string**

---

**Declaration** `utf8string = array[0..1024] of utf8char;`

**Description** UTF-8 string declaration. Index 0 contains the active length of the string in BYTES

## **utf16string**

---

**Declaration** `utf16string = array[0..255] of utf16char;`

**Description** UTF-16 string declaration. Index 0 contains the active length of the string in BYTES

## **10.5 Constants**

### **MAX\_UCS4\_CHARS**

---

**Declaration** `MAX_UCS4_CHARS = high(smallint) div (sizeof(ucs4char));`

**Description** Maximum size of a null-terminated UCS-4 character string

### **MAX\_UCS2\_CHARS**

---

**Declaration** `MAX_UCS2_CHARS = high(smallint) div (sizeof(ucs2char))-1;`

**Description** Maximum size of a null-terminated UCS-4 character string

### **UNICODE\_ERR\_OK**

---

**Declaration** `UNICODE_ERR_OK = 0;`

**Description** Return status: conversion successful

### **UNICODE\_ERR\_SOURCEILLEGAL**

---

**Declaration** `UNICODE_ERR_SOURCEILLEGAL = -1;`

**Description** Return status: source sequence is illegal/malformed

### **UNICODE\_ERR\_LENGTH\_EXCEED**

---

**Declaration** `UNICODE_ERR_LENGTH_EXCEED = -2;`

**Description** Return status: Target space exceeded

### **UNICODE\_ERR\_INCOMPLETE\_CONVERSION**

---

**Declaration** `UNICODE_ERR_INCOMPLETE_CONVERSION = -3;`

**Description** Return status: Some character could not be successfully converted to this format

## UNICODE\_ERR\_NOTFOUND

---

**Declaration** UNICODE\_ERR\_NOTFOUND = -4;

**Description** Return status: The character set is not found

## BOM\_UTF8

---

**Declaration** BOM\_UTF8 = #xEF#xBB#xBF;

**Description** Byte order mark: UTF-8 encoding signature

## BOM\_UTF32\_BE

---

**Declaration** BOM\_UTF32\_BE = #00#00#\$FE#\$FF;

**Description** Byte order mark: UCS-4 big endian encoding signature

## BOM\_UTF32\_LE

---

**Declaration** BOM\_UTF32\_LE = #FF#\$FE#00#00;

**Description** Byte order mark: UCS-4 little endian encoding signature

# Chapter 11

## Unit utils

### 11.1 Description

General utilities common to all platforms.

### 11.2 Overview

`boolstr` Convert a boolean value to an ASCII representation

`decstr` Convert a value to an ASCII decimal representation

`decstrunsigned` Convert a value to an ASCII decimal representation

`EscapeToPascal`

`FileExists` Verifies the existence of a filename

`hexstr` Convert a value to an ASCII hexadecimal representation

`Printf` Format a string and print it out to the console

`removenulls`

`StreamErrorProcedure` Generic stream error procedure

`SwapLong` Change the endian of a 32-bit value

`SwapWord` Change the endian of a 16-bit value

`TrimLeft` Remove all whitespace from the start of a string

`TrimRight` Remove all whitespace from the end of a string

`UpString` Convert a string to uppercase ASCII

`ValBinary`

ValDecimal

ValHexadecimal

ValOctal

## 11.3 Functions and Procedures

### boolstr function

---

**Declaration** `function boolstr(val: boolean; cnt: byte): string;`

**Description** Convert a boolean value to an ASCII representation

To avoid left padding with spaces, set `cnt` to zero.

### decstr function

---

**Declaration** `function decstr(val : longint;cnt : byte) : string;`

**Description** Convert a value to an ASCII decimal representation

To avoid left padding with zeros, set `cnt` to zero.

**Parameters** `val` Signed 32-bit value to convert

### decstrunsigned function

---

**Declaration** `function decstrunsigned(l : longword;cnt: byte): string;`

**Description** Convert a value to an ASCII decimal representation

To avoid left padding with zeros, set `cnt` to zero.

**Parameters** `val` unsigned 32-bit value to convert

### EscapeToPascal function

---

**Declaration** `function EscapeToPascal(const s:string; var code: integer): string;`

**Description** Converts a C style string (containing escape characters), to a pascal style string. Returns the converted string. If there is no error in the conversion, `code` will be equal to zero.

**Parameters** `s` String to convert

`code` Result of operation, 0 when there is no error

## FileExists function

---

**Declaration** `Function FileExists(FName : string): Boolean;`

**Description** Verifies the existence of a filename

This routine verifies if the file named can be opened or if it actually exists.

FName Name of the file to check

Returns FALSE if the file cannot be opened or if it does not exist.

## hexstr function

---

**Declaration** `function hexstr(val : longint;cnt : byte) : string;`

**Description** Convert a value to an ASCII hexadecimal representation

## Printf function

---

**Declaration** `function Printf(const s : string; var Buf; size : word): string;`

**Description** Format a string and print it out to the console

This routine formats the string specified in s to the format specified and returns the resulting string.

The following specifiers are allowed: %d : The buffer contents contains an integer %s : The buffer contents contains a string, terminated by a null character. %bh : The buffer contents contains a byte coded in BCD format, only the high byte will be kept. %bl : The buffer contents contains a byte coded in BCD format, only the low byte will be kept.

s The string to format, with format specifiers

buf The buffer containing the data

size The size of the data in the buffer

Returns The resulting formatted string

## removenulls function

---

**Declaration** `function removenulls(s: string): string;`

**Description** Remove all null characters from a string.

## StreamErrorProcedure procedure

---

**Declaration** `procedure StreamErrorProcedure(Var S: TStream);`

**Description** Generic stream error procedure

Generic stream error procedure that can be used to set `streamerror`

### SwapLong procedure

---

**Declaration** Procedure SwapLong(var x : longword);

**Description** Change the endian of a 32-bit value

### SwapWord procedure

---

**Declaration** Procedure SwapWord(var x : word);

**Description** Change the endian of a 16-bit value

### TrimLeft function

---

**Declaration** function TrimLeft(const S: string): string;

**Description** Remove all whitespace from the start of a string

### TrimRight function

---

**Declaration** function TrimRight(const S: string): string;

**Description** Remove all whitespace from the end of a string

### UpString function

---

**Declaration** function UpString(s : string): string;

**Description** Convert a string to uppercase ASCII

### ValBinary function

---

**Declaration** function ValBinary(const S:String; var code: integer):longint;

**Description** Convert a binary value represented by a string to its numerical value. If there is no error, code will be equal to zero.

### ValDecimal function

---

**Declaration** function ValDecimal(const S:String; var code: integer):longint;

**Description** Convert a decimal value represented by a string to its numerical value. If there is no error, code will be equal to zero.

### ValHexadecimal function

---

**Declaration** function ValHexadecimal(const S:String; var code: integer):longint;

**Description** Convert an hexadecimal value represented by a string to its numerical value. If there is no error, code will be equal to zero.

## ValOctal function

---

**Declaration** `function ValOctal(const S:String;var code: integer):longint;`

**Description** Convert an octal value represented by a string to its numerical value. If there is no error, code will be equal to zero.

## Chapter 12

# Unit `vputils`

### 12.1 Description

Virtual Pascal Compatibility unit

This unit includes common definitions so that common code can be compiled under the Virtual pascal compiler. It supports Virtual Pascal 2.1 and higher for the Win32, DOS and OS/2 targets.
